

PROGETTO ENERGIA ZERO  
sustainable architecture

---

# SEASIDE VILLAS

---

The residential complex consists of four single-family villas, oriented to prefer the natural landscape and the private gardens. The whole project is geared towards the highest technological standards and environmental sustainability, and as a consequence the reduction of energy consumption. In fact, the common thread of the project are natural materials, such as stone, white Mediterranean plaster and wood, which is also found to structural use (X-lam and frame).

# THE LAKE ESCAPE

---

Man and nature reach a wonderful synthesis here. Quiet and evocative corners overlook little villages and the background of the placid waters.

The general architecture of the complex consists of three separated buildings, set within the context of traditional inspiration, characteristic of the settlement.

# A MEDITERRANEAN HOMOLOGY

---

The Mediterranean sea is on the horizon.  
The complex is mixed with the nature of the territory in which it  
springs to life, mashing up in low density with the landscape along  
the coast, where fields, empty areas and residencial settlements are.  
Mediterranean rural architecture, pure and essential, has been source  
of inspiration for the project.
